

Subs Paper Things to Do:

- ~~# of coding and non-coding sites~~
- ~~# of subs in each of ↑~~
- Look into ~~*Streptomyces* non-coding issue~~
- Look into ~~*E. coli* coding issue~~
- Look into pSymB coding/non-coding trend weirdness
- Figure out why ~~*Streptomyces* appears to have tons of coding data missing~~
- Figure out what is going on with cod/non-cod code and why it is still not working!
- write up methods for coding/non-coding
- write methods and results for clustering
- start code to split alignment into multiple alignments of each gene
- figure out how to deal with overlapping genes
- figure out how to deal with gaps in gene of ref taxa
- split up the alignment into multiple alignments of each gene
- check if each gene alignment is a multiple of 3 (proper codon alignment)
- get dN/dS for coding/non-coding stuff per gene
- Or get 1st, 2nd, 3rd codon pos log regs
- write up coding/non-coding results
- take out gene expression from this paper
- write better intro/methods for distribution of subs graphs
- write discussion for coding/non-coding
- write coding/non-coding into conclusion
- figured out pipeline for CODEML to calculate dN/dS for each gene
- grab genes from each gbk file
- align ↑ with a codon-aware aligner
- make a list of what should be in supplementary files for subs paper
- put everything in list into supplementary file for subs paper
- write dN/dS methods

- write dN/dS results
- write dN/dS discussion
- write dN/dS into conclusion
- ~~new bar graph with coding and non-coding sites separated~~
- mol clock for my analysis?
- GC content? COG? where do these fit?

#### Gene Expression Paper Things to Do:

- ~~look for more GEO expression data for *S. meliloti*~~
- ~~look for more GEO expression data for *Streptomyces*~~
- ~~look for more GEO expression data for *B. subtilis*~~
- ~~format paper and put in stuff that is already written~~
- ~~look for more GEO expression data for *E. coli*~~
- ~~Get numbers for how many different strains and multiples of each strain I have for gene expression~~
- ~~re-do gene expression analysis for *B. subtilis*~~
- ~~re-do gene expression analysis for *E. coli*~~
- ~~find papers about what has been done with gene expression~~
- ~~read papers ↑~~
- ~~put notes from ↑ papers into word doc~~
- write abstract
- write intro
- add stuff from outline to Data section
- create graphs for expression distribution (no sub data)
- add # of genes to expression graphs (top)
- average gene expression
- write discussion
- write conclusion
- add into methods: filters for Hiseq, RT PCR and growth phases for data collection

- update supplementary figures/file

### Inversions and Gene Expression Letter Things to Do:

- ~~get as much GEO data as possible~~
- ~~find papers about inversions and expression~~
- ~~see how many inversions I can identify in these strains of *Escherichia coli* with gene expression data~~
- ~~read papers about inversions~~
- check if opposite strand in progressiveMauve means an inversions (check visual matches the xmfa)
- check if PARSNP and progressiveMauve both identify the same inversions (check xmfa file)
- create latex template for paper
- ~~put notes from papers into doc~~
- use large PARSNP alignment to identify inversions
- confirm inversions with dot plot
- write outline for letter
- write Abstract
- write intro
- write methods
- compile tables (supplementary)
- write results
- write discussion
- write conclusion
- do same ancestral/phylogenetic analysis that I did in the subs paper

## Last Week

✓wrote detailed outline for gene expression paper

✓FINALLY figured out and fixed the *E. coli* issue with most sites in the alignment not being the same codon classification

I wrote a detailed outline for my gene expression paper and plan on writing at the very least the introduction this weekend.

Alignment Column Classification: I realized that there were two things that I forgot to account for in the alignment column classification: 1) some genes are complement and therefore their codon classification should be 3,2,1 instead of 1,2,3. 2) progressiveMauve sometimes recognizes that the complement of one taxa may better align to the rest of the taxa, which alters what the start and end of that block is (they get switch and therefore I was looking at the wrong gene for one taxa!). I have fixed both of these things in my code and now everything makes sense! All of the test blocks I looks at (2 from *E. coli* and 2 from *B. subtilis*) have only 4-5% of the alignment where not all taxa have the same classification and between 48-85% of the alignment that has all taxa with the same classification. This number is so varied because of the number of gaps in each of the alignments. Blocks with more gaps have therefore less sites available to be the same classification.

## This Week

Since I have figured out what is going on with the alignment column classification, I plan on re-doing the coding and non-coding substitution analysis this week with the correct coding and non-coding sections. I do not expect the results to change that much because the starts and stops of genes remains the same, it would only be the reversed complement taxa that would have things impacted.

I would also like to develop some sort of pipeline for finding the dN/dS for each gene in all of my bacteria. Now that the alignments are actually aligning the sequences properly, we might not have to re-align the genes with a codon aware aligner. I need to think about this more.

I would also like to write the intro to my gene expression paper by the end of this week.

## Next Week

I would like to implement the above pipeline for calculating the dN/dS for each gene and put all these results in to a coherent table.

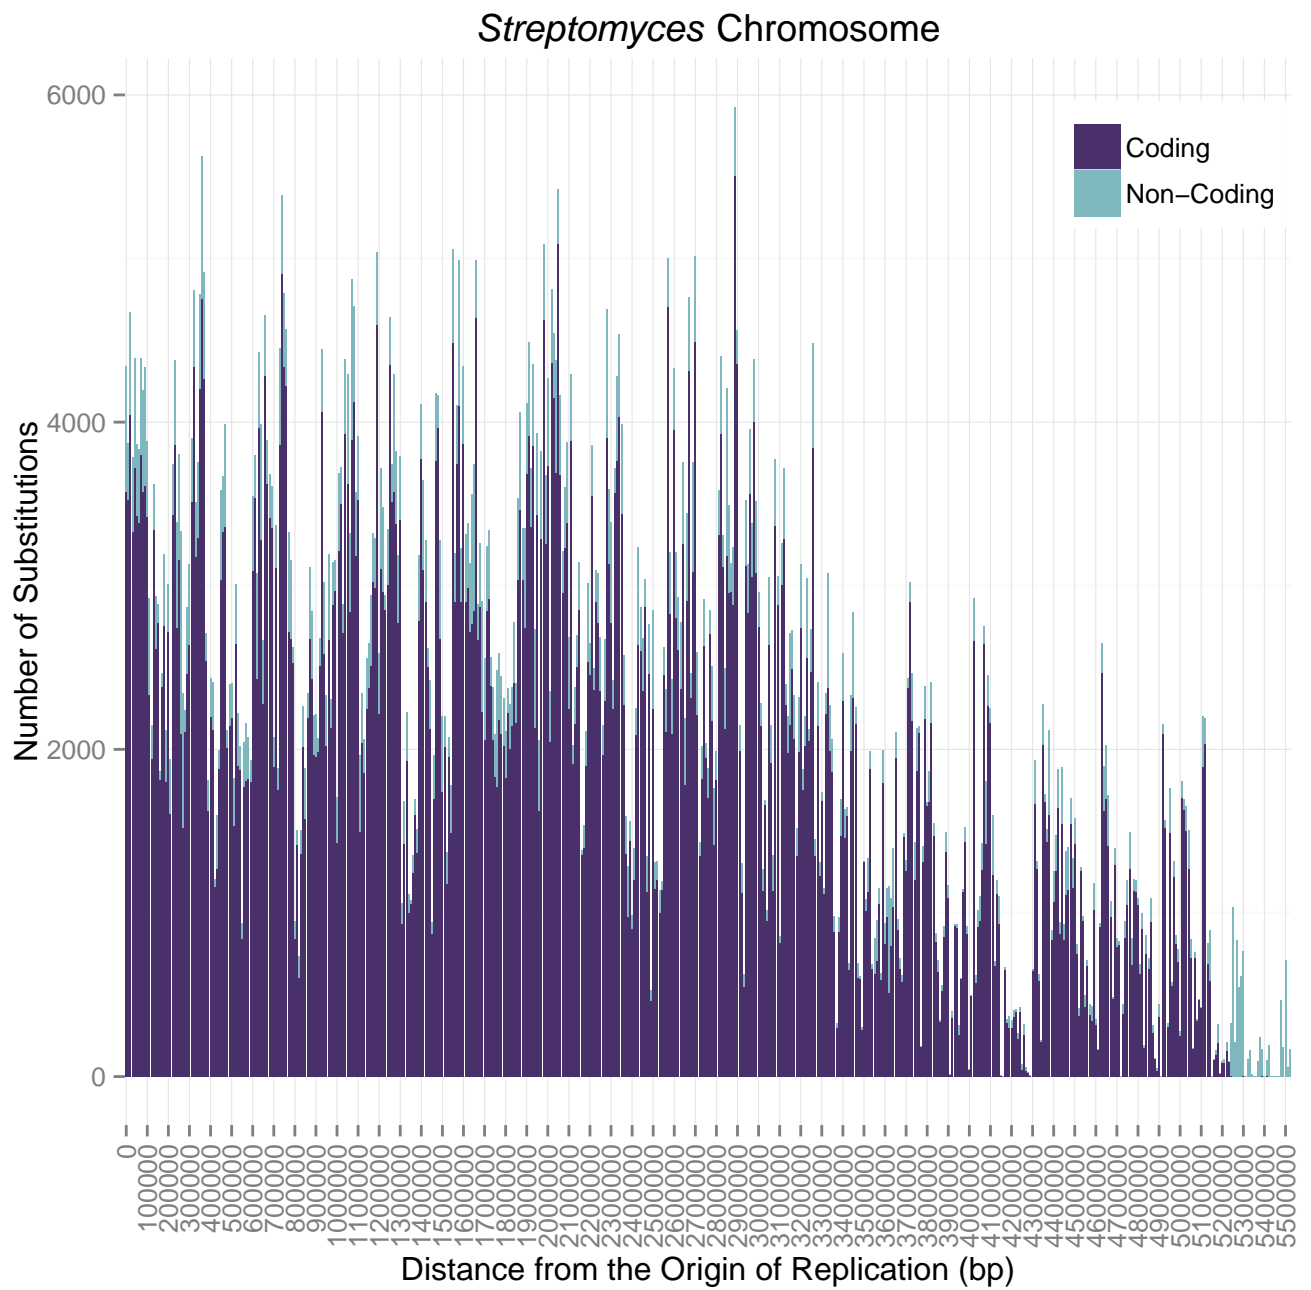

I want to begin figuring out how to obtain all inversions from the Mauve or PARSNP alignment for the inversions analysis.

Classification	Number of Nucleotides in Alignment	% of Total Alignment
Gapped	78450	31%
Not same class	138002	55%
Same class	35852	15%
Codon 1	113	<0.05%
Codon 2	113	<0.05%
Codon 3	113	<0.05%
Misc 4	0	0
Non-coding	35513	15%

Table 1: Classification of each column in the alignment of ONE sample *E. coli* block with a total alignment length of 252304. The percentages are calculated based on the WHOLE alignment length. The "same class" classification is any column where all taxa had the same classification. "Not same class" is any column where at least one taxa did not have the same classification as the rest of the taxa in that column. The "Same class" category can be further broken down into the different nucleotide classifications to show how often those were found to be the same between all taxa in a column. The "Gapped" category denotes a site where at least one taxa had a gap present.

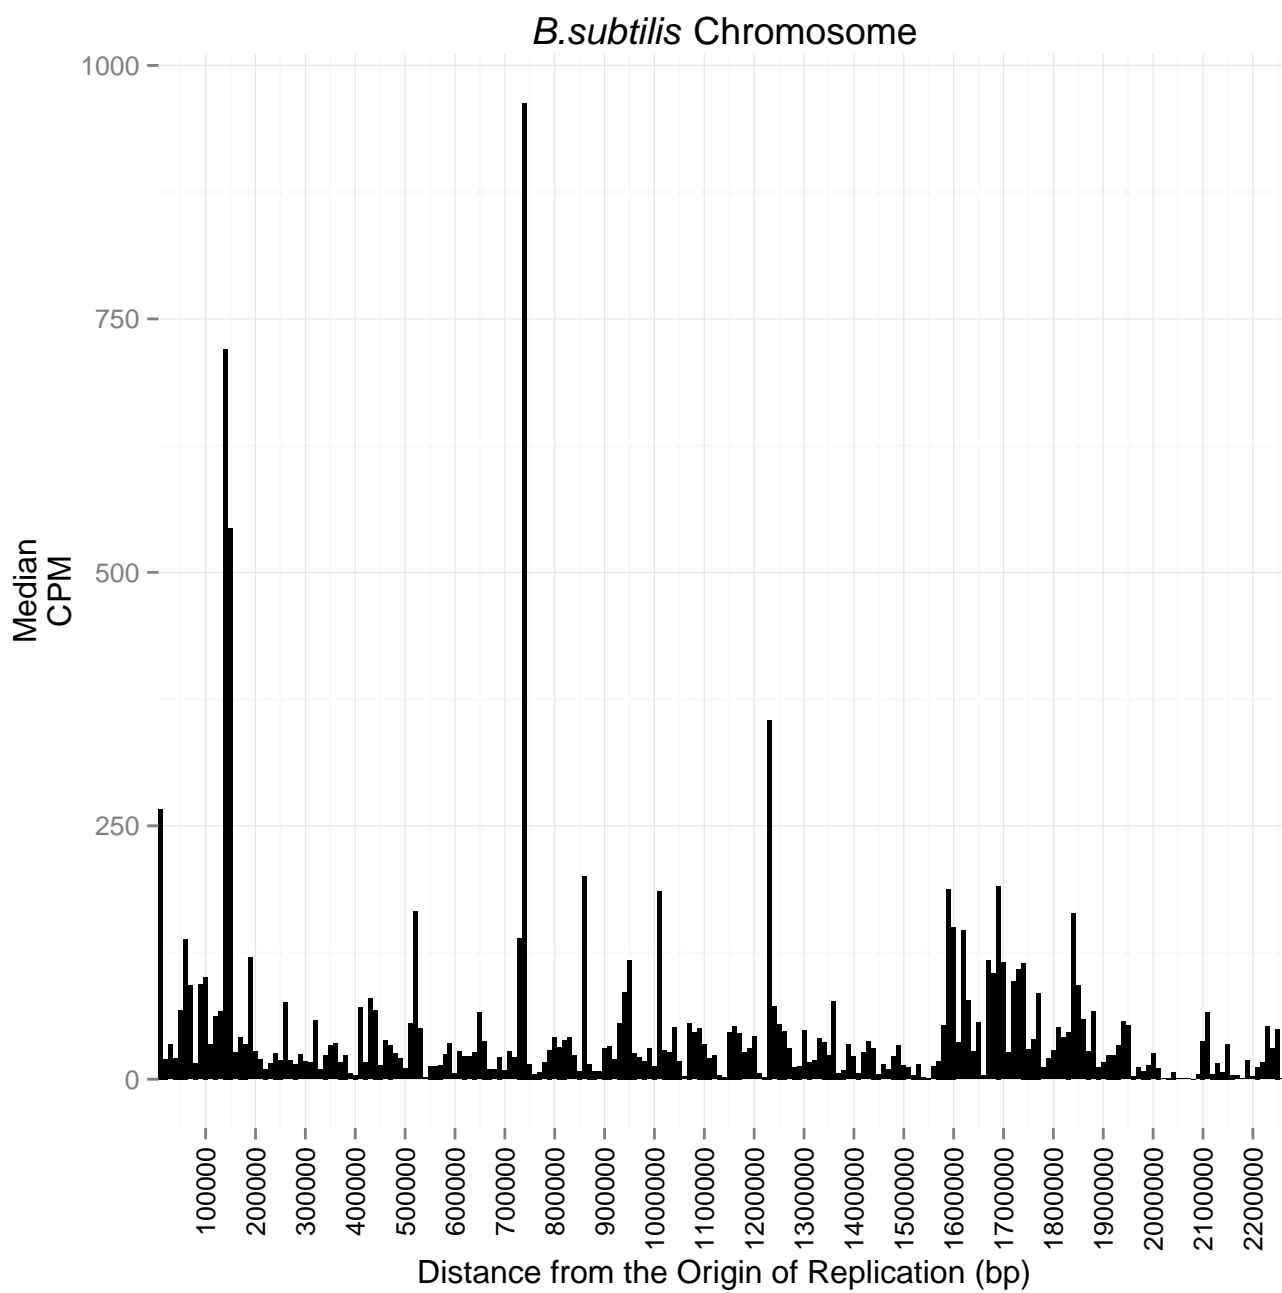

*Streptomyces* Chromosome

Bacteria and Replicon	% of Coding Sequences	% of Non-Coding Sequences	% of Subs Coding	% of Subs Non-Coding
<i>E. coli</i> Chromosome	86.47%	13.53%	5.00%	8.96%
<i>B. subtilis</i> Chromosome	87.49%	12.51%	7.31%	6.42%
<i>Streptomyces</i> Chromosome	89.03%	10.97%	13.74%	14.91%
<i>S. meliloti</i> Chromosome	86.27%	13.73%	0.19%	0.22%
<i>S. meliloti</i> pSymA	83.34%	16.66%	2.84%	4.58%
<i>S. meliloti</i> pSymB	88.81%	11.19%	2.78%	3.44%

Table 2: Total proportion of coding and non-coding sites in each replicon and the percentage of those sites that have a substitution (multiple substitutions at one site are counted as two substitutions).

Bacteria and Replicon	Coding Sequences	Non-Coding Sequences
<i>E. coli</i> Chromosome	$-5.938 \times 10^{-8***}$	$-9.237 \times 10^{-8***}$
<i>B. subtilis</i> Chromosome	$-7.584 \times 10^{-8***}$	NS
<i>Streptomyces</i> Chromosome	$5.483 \times 10^{-7***}$	$9.182 \times 10^{-9***}$
<i>S. meliloti</i> Chromosome	$-1.448 \times 10^{-6***}$	$-7.037 \times 10^{-7***}$
<i>S. meliloti</i> pSymA	$-9.704 \times 10^{-7***}$	$-1.464 \times 10^{-7***}$
<i>S. meliloti</i> pSymB	$5.007 \times 10^{-7***}$	NS

Table 3: Logistic regression analysis of the number of substitutions along all positions of the genome of the respective bacteria replicons. These genomic positions were split up into the coding and non-coding regions of the genome. Grey coloured boxes indicate a negative logistic regression coefficient estimate. All results are statistically significant. Logistic regression was calculated after the origin of replication was moved to the beginning of the genome and all subsequent positions were scaled around the origin accounting for bidirectionality of replication. All results are marked with significance codes as followed:  $< 0.001 = '***'$ ,  $0.001 < 0.01 = '**'$ ,  $0.01 < 0.05 = '*'$ ,  $> 0.05 = 'NS'$ .

Bacteria Strain/Species	GEO Accession Number	Date Accessed
<i>E. coli</i> K12 MG1655	GSE60522	December 20, 2017
<i>E. coli</i> K12 MG1655	GSE73673	December 19, 2017
