### Subs Paper Things to Do:

- # of coding and non-coding sites
- # of subs in each of \(\dagger
- Look into Streptomyces non-coding issue
- Look into E. coli coding issue
- Look into pSymB coding/non-coding trend weirdness
- Figure out why Streptomyces appears to have tons of coding data missing
- Figure out what is going on with cod/non-cod code and why it is still not working!
- write up methods for coding/non-coding
- write methods and results for clustering
- start code to split alignment into multiple alignments of each gene
- figure out how to deal with overlapping genes
- figure out how to deal with gaps in gene of ref taxa
- split up the alignment into multiple alignments of each gene
- check if each gene alignment is a multiple of 3 (proper codon alignment)
- get dN/dS for coding/non-coding stuff per gene
- Or get 1st, 2nd, 3rd codon pos log regs
- write up coding/non-coding results
- take out gene expression from this paper
- write better intro/methods for distribution of subs graphs
- write discussion for coding/non-coding
- write coding/non-coding into conclusion
- figured out pipeline for CODEML to calculate dN/dS for each gene
- grab genes from each gbk file
- align \(\gamma\) with a codon-aware aligner
- make a list of what should be in supplementary files for subs paper
- put everything in list into supplementary file for subs paper
- write dN/dS methods

- write dN/dS results
- write dN/dS discussion
- write dN/dS into conclusion
- new bar graph with coding and non-coding sites separated
- mol clock for my analysis?
- GC content? COG? where do these fit?

#### Gene Expression Paper Things to Do:

- look for more GEO expression data for S. meliloti
- look for more GEO expression data for Streptomyces
- look for more GEO expression data for *B. subtilis*
- format paper and put in stuff that is already written
- look for more GEO expression data for E. coli-
- Get numbers for how many different strains and multiples of each strain I have for gene expression
- re-do gene expression analysis for B. subtilis
- re-do gene expression analysis for E. coli
- find papers about what has been done with gene expression
- read papers †
- put notes from \(\gamma\) papers into word doc
- write abstract
- write intro
- add stuff from outline to Data section
- create graphs for expression distribution (no sub data)
- add # of genes to expression graphs (top)
- average gene expression
- write discussion
- write conclusion
- add into methods: filters for Hiseq, RT PCR and growth phases for data collection

• update supplementary figures/file

### Inversions and Gene Expression Letter Things to Do:

- get as much GEO data as possible
- find papers about inversions and expression
- see how many inversions I can identify in these strains of *Escherichia coli* with gene expression data
- read papers about inversions
- check if opposite strand in progressiveMauve means an inversions (check visual matches the xmfa)
- check if PARSNP and progressive Mauve both identify the same inversions (check xmfa file)
- create latex template for paper
- put notes from papers into doc
- use large PARSNP alignment to identify inversions
- confirm inversions with dot plot
- write outline for letter
- write Abstract
- write intro
- write methods
- compile tables (supplementary)
- write results
- write discussion
- write conclusion
- do same ancestral/phylogenetic analysis that I did in the subs paper

## Last Week

 $\checkmark$  finished code to get codon classification for each column in the alignment (to see if we are comparing codon position 1 with codon position 1)

Last week I was mostly working on the code to properly classify each column in the alignment as codon position 1, 2, 3, non-coding (0), or overlapping with another gene (4). This took a very long time because I kept running into errors and realizing that I had to account for more situations (like different kinds of overlap) than I thought. A summary of what I found for ONE sample alignment block from *Escherichia coli* is below.

Last week I was mostly busy with my competition but I got a few things done. Before the break we determined that if you have one gene overlapping with 2 genes from another taxa there could be a situation where the nucleotides in one column of an alignment are not the same class. So they may not be the 1st codon position, or 2nd...etc. Since then, I have been working on determining how often this happens in the alignment of a sample block from *Escherichia coli*. I have gotten this information but, it becomes more complicated when there are genes within genes in some of the taxa. This means that some genes overlap WITHIN a taxa and so one particular site in the alignment may be classified as more than one thing (1st, 2nd, 3rd, or non coding). I am still working on how to classify/deal with this issue to get accurate information about each column in the alignment.

Once that is figured out then I can re-do the coding/non-coding part of the analysis.

I also sent you a draft of my substitutions paper before reading week which I would really appreciate your feedback on.

I also read and made notes on quite a few papers last week, gathering more information about gene expression and inversions.

# This Week

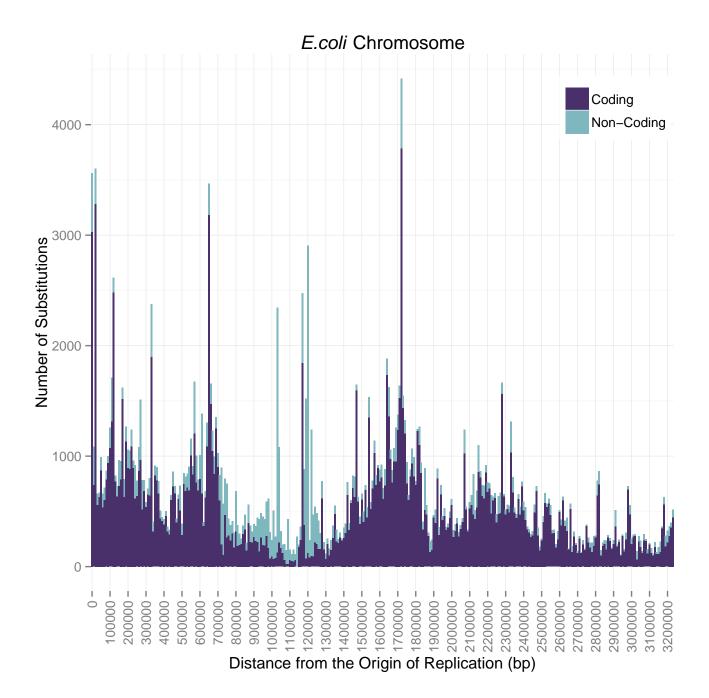

I would like to have the data on how many columns of the alignments are actually comparing the same nucleotide classification (1st, 2nd, 3rd, non-coding) and then make a decision on how to deal with the results from this.

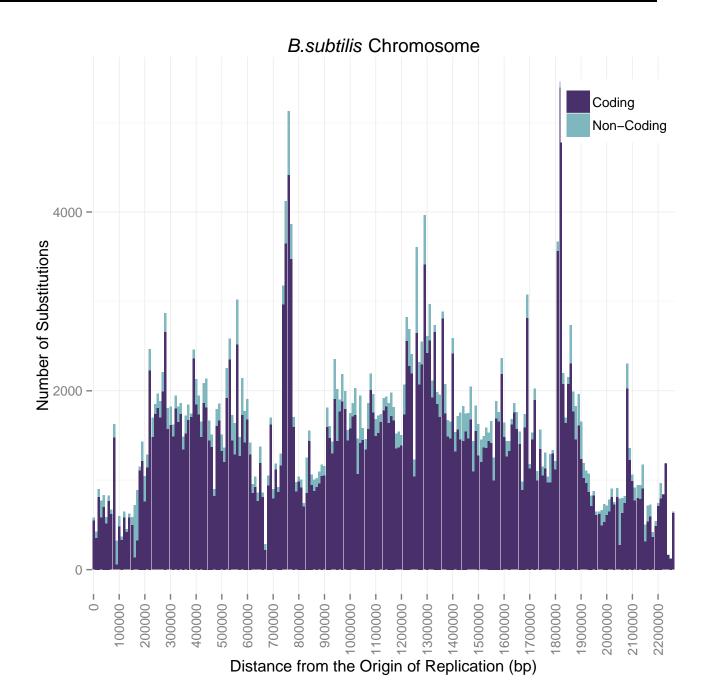

# Next Week

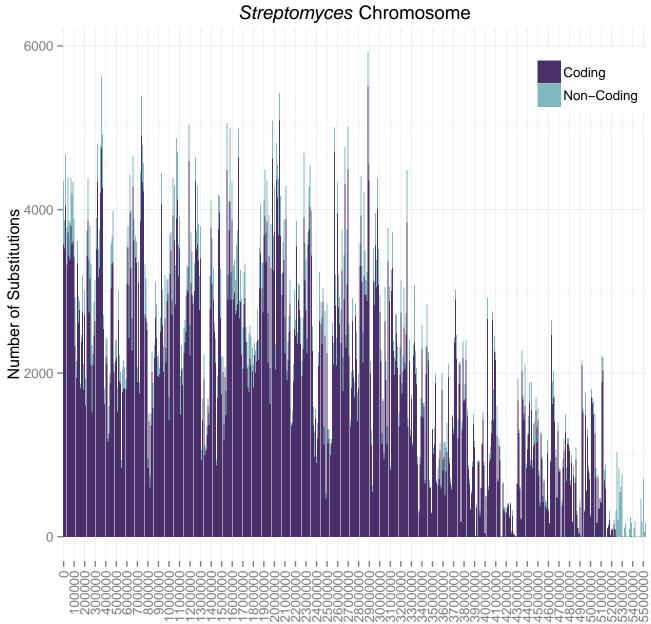

I would like to implement some sort of plan for how to deal with sites in the alignment that do not compare the same nucleotide classifications. Then I can hopefully re-run the coding and non-coding analysis and any PRANK alignments that have to happen.

Classification	Number of Nucleotides in Alignment	% of Total Alignment
Gapped	78450	31%
Not same class	138002	55%
Same class	35852	15%
Codon 1	113	< 0.05%
Codon 2	113	< 0.05%
Codon 3	113	< 0.05%
Misc 4	0	0
Non-coding	35513	15%

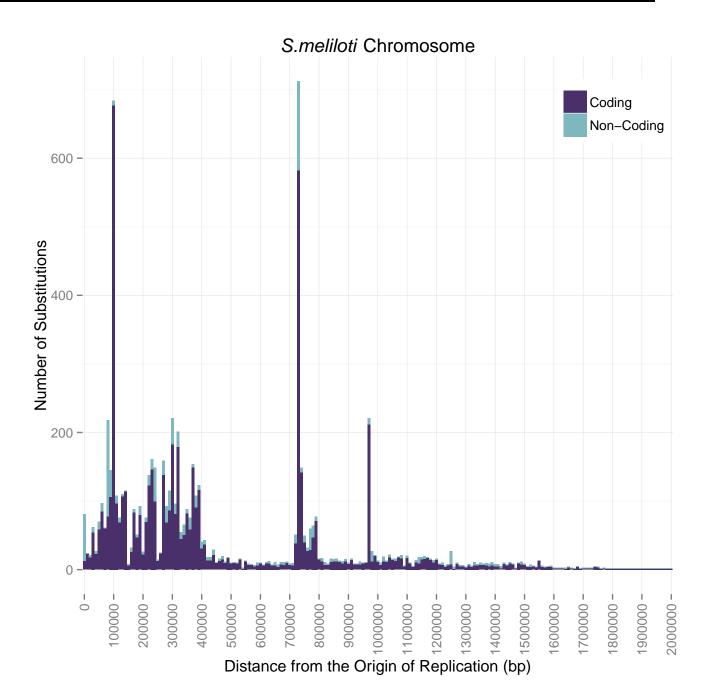

Table 1: Classification of each column in the alignment of ONE sample *E. coli* block with a total alignment length of 252304. The percentages are calculated based on the WHOLE alignment length. The "same class" classification is any column where all taxa had the same classification. "Not same class" is any column where at least one taxa did not have the same classification as the rest of the taxa in that column. The "Same class" category can be further broken down into the different nucleotide classifications to show how often those were found to be the same between all taxa in a column. The "Gapped" category denotes a site where at least one taxa had a gap present.

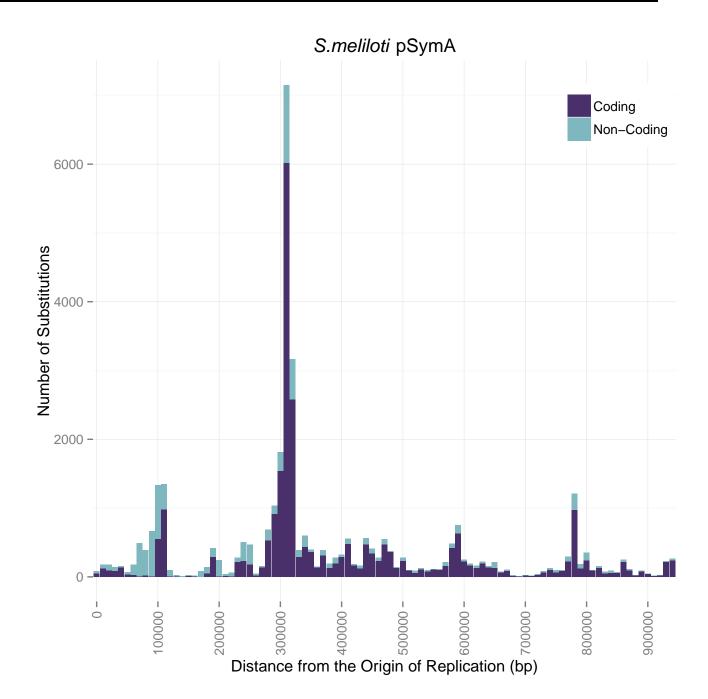

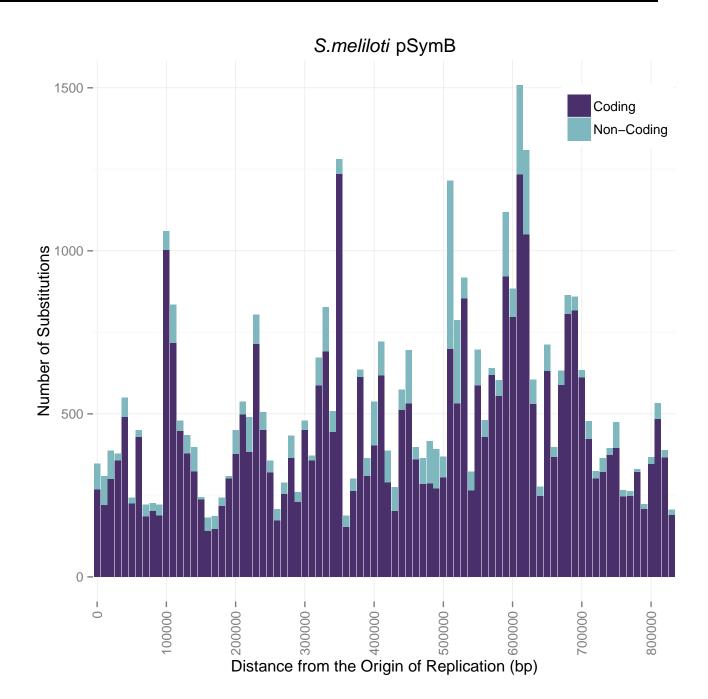

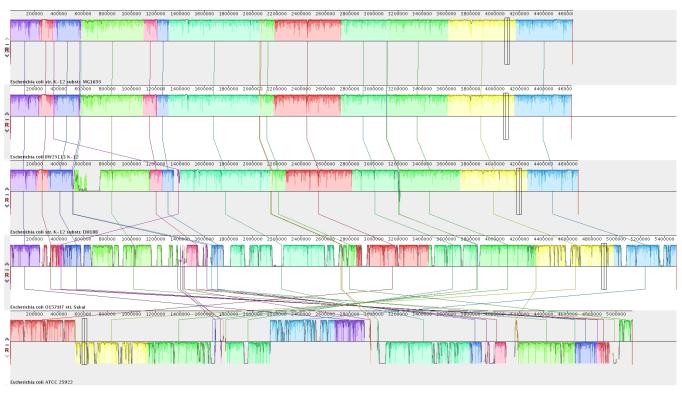

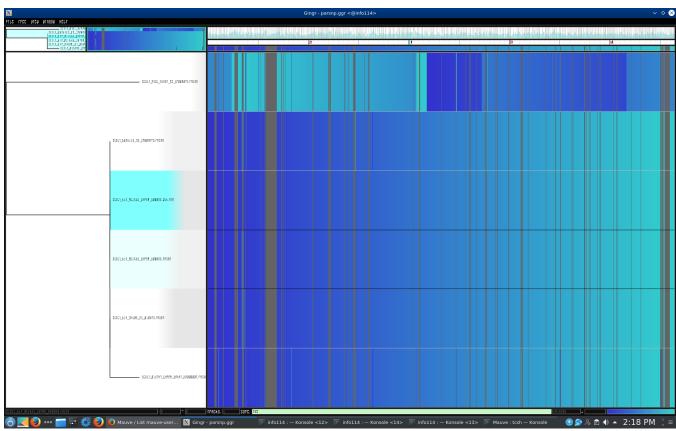

Distance from the Origin of Replication (bp)

Bacteria and Replicon	% of Coding Sequences	% of Non-Coding Sequences	% of Subs Coding	% of Subs Non-Coding
E. coli Chromosome	86.47%	13.53%	5.00%	8.96%
B. subtilis Chromosome	87.49%	12.51%	7.31%	6.42%
Streptomyces Chromosome	89.03%	10.97%	13.74%	14.91%
$S. \ meliloti \ { m Chromosome}$	86.27%	13.73%	0.19%	0.22%
$S.\ meliloti\ pSymA$	83.34%	16.66%	2.84%	4.58%
$S.\ meliloti\ p{ m Sym}{ m B}$	88.81%	11.19%	2.78%	3.44%

Table 2: Total proportion of coding and non-coding sites in each replicon and the percentage of those sites that have a substitution (multiple substitutions at one site are counted as two substitutions).

Bacteria and Replicon	Coding Sequences	Non-Coding Sequences
E. coli Chromosome	$-5.938 \times 10^{-8***}$	$-9.237 \times 10^{-8***}$
B. subtilis Chromosome	$-7.584 \times 10^{-8} ***$	NS
Streptomyces Chromosome	$5.483 \times 10^{-7} ***$	$9.182 \times 10^{-9} ***$
$S.\ meliloti$ Chromosome	$-1.448 \times 10^{-6} ***$	$-7.037 \times 10^{-7} ***$
$S. \ meliloti \ pSymA$	$-9.704 \times 10^{-7} ***$	$-1.464 \times 10^{-7} ***$
S. meliloti pSymB	$5.007 \times 10^{-7} ***$	NS

Table 3: Logistic regression analysis of the number of substitutions along all positions of the genome of the respective bacteria replicons. These genomic positions were split up into the coding and non-coding regions of the genome. Grey coloured boxes indicate a negative logistic regression coefficient estimate. All results are statistically significant. Logistic regression was calculated after the origin of replication was moved to the beginning of the genome and all subsequent positions were scaled around the origin accounting for bidirectionality of replication. All results are marked with significance codes as followed: < 0.001 = "\*\*", 0.001 < 0.01 = "\*\*", 0.01 < 0.05 = "\*", > 0.05 = "NS".

Bacteria Strain/Species	GEO Accession Number	Date Accessed
E. coli K12 MG1655	GSE60522	December 20, 2017
$E.\ coli\ \mathrm{K}12\ \mathrm{M}G1655$	GSE73673	December 19, 2017
